1. STATEMENT OF COMPLIANCE

The Modweigh MP1 Industrial Weighing Equipment complies with EN 61326-1:2013.

2. RESULTS SUMMARY

The results from testing carried out in April and June 2018 are summarised in the following table:

Parameter	Criteria	Result
Radiated Emissions		
30 – 1000 MHz	Class A	Complies with a 2.4 dB margin at 179.960 MHz (Vertical).
Conducted Emissions		
150 kHz – 30 MHz	Class B	Not applicable. DC powered device.
Flicker Harmonics		
Harmonic Current Emissions	-	Not applicable. DC powered device.
Voltage Fluctuations and Flicker	-	Not applicable. DC powered device.
Enclosure		
ESD Contact +/- 4 kV	B	Complies
ESD Air +/- 8 kV	B	Complies
Radiated Fields		
80 – 1000 MHz 10 V/m	A	Complies
1400 – 2000 MHz 3 V/m	A	Complies
2000 – 2700 MHz 3 V/m	A	Complies
Power Frequency Magnetic		
30 A/m, 50 Hz	A	Complies
AC Power		
Dips	B/C	Not applicable. DC powered device.
Short Interrupts	C	Not applicable. DC powered device.
Burst	B	Not applicable. DC powered device.
Surge	B	Not applicable. DC powered device.
Conducted RF	A	Not applicable. DC powered device.
DC Power		
Burst	B	Complies
Surge	B	Complies
Conducted RF	A	Complies
I/O		
Burst	B	Complies
Surge	B	Complies
Conducted RF	A	Complies
I/O to Mains Supply		
Burst	B	Not applicable. DC powered device.
Surge	B	Not applicable. DC powered device.
Conducted RF	A	Not applicable. DC powered device.

3. INTRODUCTION

This report describes the tests and measurements performed for the purpose of determining compliance with the specification.

The client selected the test sample.

This report relates only to the sample tested.

This report contains no corrections or erasures.

Measurement uncertainties with statistical confidence intervals of 95% are shown below test results. Both Class A and Class B uncertainties have been accounted for, as well as influence uncertainties where appropriate.

All compliance statements have been made with respect of the specification limit with no reference to the measurement uncertainty.

4. CLIENT INFORMATION

Company Name	EMC Industrial Group Ltd
Address	56 Tarndale Grove, Rosedale
City	Auckland 0632
Country	New Zealand.
Contact	Mark Armstrong

5. DESCRIPTION OF TEST SAMPLE

Brand Name	Modweigh
Model	MP1
Product	Industrial Weighing Equipment
Manufacturer	EMC Industrial Group Ltd
Country of Origin	New Zealand
Serial Number	-

6. SETUPS AND PROCEDURES

Standard

The sample was tested in accordance with EN 61326-1:2013 Table 2 – for equipment intended to be used in an industrial electromagnetic environment, which calls up testing to the following base standards.

Test Method	Standard
Conducted and Radiated Emissions	EN 55011
Harmonic Current Emissions	EN 61000-3-2
Voltage Fluctuations and Flicker	EN 61000-3-3
Electrostatic Discharges	EN 61000-4-2
RF Radiated Immunity	EN 61000-4-3
Electrical Fast Transient bursts	EN 61000-4-4
Surges	EN 61000-4-5
Radio Frequency Conducted Immunity	EN 61000-4-6
Power Frequency Magnetic Immunity	EN 61000-4-8
Voltage Dips & Interruptions	EN 61000-4-11

The following performance criteria have been applied

Performance Criterion A:

The apparatus shall continue to operate as intended during the test.

No degradation of performance or loss of function is allowed below a performance level (or permissible loss of performance) specified by the manufacturer, when the apparatus is used as intended.

If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation and what the user may reasonably expect from the apparatus if used as intended.

Performance Criterion B:

The apparatus shall continue to operate as intended during the test.

No degradation of performance or loss of function is allowed below a performance level (or permissible loss of performance) specified by the manufacturer, when the apparatus is used as intended.

During the test, degradation of performance is allowed however.

No change of actual operating state or stored data is allowed.

If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation and what the user may reasonably expect from the apparatus if used as intended.

Performance Criterion C:

Temporary loss of function is allowed, provided the function is self-recoverable or can be restored by the operation of the controls, or by any operation specified in the instructions for use.

General Set Up

The device was powered from a 24 VDC lead acid battery which was supplied directly to the MP1 module.

The System comprised of the MP1 Display and main unit, connected directly to a MR1 (ModWeigh Receiver) and a Load Cell

The Load Cell was loaded to produce a deflection from the nominal value and the screen monitored for changes to this displayed value.

Any deviation >5% of nominal value would be noted and referred to the manufacturer.

7. RESULTS

Radiated emissions

Radiated emissions testing was carried out over the frequency range of 30 to 1000 MHz.

Testing was carried out at the laboratory's open area test site - located at 670 Kawakawa Orere Rd, RD5 Papakura, New Zealand.

Before testing was carried out, a receiver Self Test and Internal Calibration was undertaken along with a check of all connecting cables and programmed antenna factors.

The device was placed on the test tabletop, which was a total of 0.8 m above the test site ground plane.

Measurements of the radiated field were made by manually scanning between 30 and 1000 MHz in 100 kHz steps while aurally and visually monitoring for emissions.

Measurements were made at a distance of 10 meters between 30 – 1000 MHz with the Class A limits being applied.

When an emission is located, it is positively identified and its maximum level is found by rotating the automated turntable, and by varying the antenna height with an automated antenna tower.

The emission is measured in both vertical and horizontal antenna polarisations using a Quasi Peak detector with a bandwidth of 120 kHz below 1 GHz.

During the test, a number of ambient emissions are identified (list of which can be provided upon request).

The emission level is determined in field strength by taking the following into consideration:

Level (dB μ V/m) = Receiver Reading (dB μ V) + Antenna Factor (dB/m) + Coax Loss (dB)

Measurement uncertainty with a confidence interval of 95% is:

- Free radiation tests (30 – 1000 MHz) \pm 4.1 dB

Radiated Emissions 30 – 1000 MHz

The device was powered from a 24 Vdc lead acid battery.

The device was positioned upright in the centre of the turntable.

All system modules were positioned vertically on top of the turntable.

Frequency (MHz)	Vertical (dBuV/m)	Horizontal (dBuV/m)	Limit (dBuV/m)	Margin (dB)	Result	Antenna
41.560	31.6		40.0	8.4	Pass	Vertical
89.960	29.8	23.6	40.0	10.2	Pass	Vertical
109.600	20.6		40.0	19.4	Pass	Vertical
165.160	36.4		40.0	3.6	Pass	Vertical
179.960	37.6	34.3	40.0	2.4	Pass	Vertical
269.920	26.3	34.6	47.0	12.4	Pass	Horizontal
359.960	33.4	38.2	47.0	8.8	Pass	Horizontal
449.960	28.9	43.7	47.0	3.3	Pass	Horizontal
539.920	34.0	33.6	47.0	13.0	Pass	Vertical
629.920		34.8	47.0	12.2	Pass	Horizontal
719.920	38.7	38.6	47.0	8.3	Pass	Vertical
809.920	32.6	30.6	47.0	14.4	Pass	Vertical
899.920	37.0	33.6	47.0	10.0	Pass	Vertical

The level at 179.960 MHz is derived from the following.

Level (dB μ V/m) = Receiver Reading (dB μ V) + Antenna Factor (dB/m) + Coax Loss (dB)

$$37.6 \text{ (dB}\mu\text{V/m)} = 22.8 \text{ (dB}\mu\text{V)} + 13.3 \text{ (dB/m)} + 1.5 \text{ (dB)}$$

No further emissions were detected within 15 dB of the limit when measurements were attempted between 30 - 1000 MHz using both vertical and horizontal polarisations.

Result: Complies.

Electrostatic Discharge Testing

Electrostatic Discharge testing was carried out as described below.

The device is required to meet performance criteria B

The calibration uncertainties for Electrostatic Discharge to EN 61000-4-2 are:

- DC Voltage	1%
- Peak Current	5%
- Rise Time	6%
- Curve decay points at 30 and 60 ns	5%

Observations:

10 x ± 2 kV, ± 4 kV contact discharges were applied at one second intervals as follows:

Point of Contact	Observation	Result
HCP	No effects observed.	Pass
VCP – Front Screen MP1	No effects observed.	Pass
MD1: “Device” port surround	MR1 Restarts. Weight display unchanged.	Pass
MD1: USB Host port surround	MR1 Restarts. Weight display unchanged.	Pass
MD1: Rear Screws	MR1 Restarts. Weight display unchanged.	Pass
MD1: Rear Cover	No effects observed.	Pass
MR1: Cover	-ve discharges: MR1 Restarts Weight display unchanged	Pass
MR1: Rear Screws	-ve discharges: MR1 Restarts Weight display unchanged	Pass
Load Cell	± 30% deviation to weight. Returns immediately to nominal reading.	Pass

10 x ± 2 kV, ± 4 kV ± 8 kV air discharges were applied at one second intervals as follows:

Point of Contact	Observation	Result
Screen	No discharges occurred	Pass
Keypad	No discharges occurred	Pass
Cable MD1 – MR1	No discharges occurred	Pass
Cable MR1 – MT1	No discharges occurred	Pass
Load Cell Cable	No discharges occurred	Pass
MR1 Ribbon Cables	No discharges occurred	Pass

Result: Complies.

The device displayed susceptibility to Electrostatic Discharges during testing but returned to normal operation and nominal weight display without user intervention.

Radio Frequency Electromagnetic Field

Testing was carried out between 80 – 1000 MHz at 10 V/m with a dwell time of 3 seconds and between 1400 – 2700 MHz at 3 V/m with a dwell time of 9 seconds in 1% steps using both vertical and horizontal polarisations.

The RF signal was 80% AM modulated using a 1 kHz tone.

The antenna was positioned 155 cm above the floor surface with the tip of the antenna being 2 meters from the device under test

During the test the RF field was continuously monitored using an isotropic field probe which was placed close to the device under test.

The Radiated RF was injected into the front, left hand and rear faces of the device's modules.

The device is required to meet the performance criteria A.

The calibration uncertainties for Radiated Susceptibility to EN 61000-4-3 are:
80 - 2700 MHz +/- 1.1 V/m

Observations:

No effects were observed.

Result: Complies.

The device displayed immunity to Radiated RF Electromagnetic Fields during the test and did not change state or lose stored data.

The device operated normally after the test.

Electrical Fast Transient/Burst (EFT/B)

Testing was carried out on the DC power port directly at ± 2 kV and on any signal ports with cables that will exceed 3 metres using a capacitive clamp at ± 1 kV for periods of 2 minutes while the device was being operated.

The device is required to meet performance criteria B.

The calibration uncertainties for Electrically Fast Transient Bursts to IEC 61000-4-4 are:

-Peak Output Voltage Upeak	3.0 %
-Rise Time tr	2.5 %
-Pulse Width tw	2.0 %
-Burst Frequency fb	1.0 %
-Burst Duration tb	1.0 %
-Burst Period trep	1.0 %

Observations

DC power port ± 2 kV (5/50 ns, 5 kHz)

Port Tested	Observations	Result
+ve:PE	No effects observed	Pass
-ve:PE	No effects observed	Pass
+ve:-ve	No effects observed	Pass

Signal power port ± 1 kV (5/50 ns, 5 kHz)

Port Tested	Observations	Result
Load cell	No effects observed	Pass

Result: Complies.

The device displayed immunity to Electrical Fast Transients/Bursts (EFT/B) during the tests.

The device continued to operate normally after the test.

Surges

Surge testing was carried out on the DC mains port as described below:

- ± 1.0 kV Line to Line;
- ± 2.0 kV Line to Earth;
- ± 1.0 kV Signal lines; direct coupling. Not applicable.

A one-minute interval occurred between each surge.

The device was required to meet performance criteria B.

The calibration uncertainties for Surges to EN 61000-4-5 are:

- Open circuit peak voltage U_{peak} 2%
- Short circuit peak current I_{peak} 2%
- Risetime t_r 2.5%
- Pulse width t_w 2.5%

Observations

Line/Port Tested	Observation	Result
+ve:PE	No effects observed	Pass
-ve:PE	No effects observed	Pass
+ve:-ve	No effects observed	Pass

Result: Complies.

The device displayed immunity to Surges throughout the test.

The device continued to operate normally after the test.

Conducted RF Susceptibility

Conducted RF susceptibility testing was carried out between 150 kHz and 80 MHz at $3 V_{\text{rms}}$ with a 1000 Hz tone 80% AM modulated.

Testing was carried out in 1% steps with a dwell time of 3 seconds

The device is required to meet performance criteria A.

The calibration uncertainties for Radio frequency continuous conducted susceptibility to EN 61000-4-6 are: 0.15 – 80.0 MHz \pm 1.42 dB

Testing performed with chassis grounded via M1 CDN with 50 Ω impedance.

Observations:

Port Tested	Method	Observations	Result
DC port	DC2 CDN	No effects observed	Pass
Load Cell	FCC BCI Clamp	No effects observed	Pass
MP1: MR1 connector cable	FCC BCI Clamp	No effects observed	Pass

Result: Complies.

The device displayed immunity to Conducted RF Electromagnetic Fields throughout the test.

The device continued to operate normally after the test.

Power Frequency Magnetic Fields

As the device operates at 24 Vdc testing was carried out at 50 Hz & 60 Hz.

Testing was carried out using a 1m x 1m loop that was placed around the device in the X, Y and Z planes.

The device was required to meet Category A.

Testing was carried out at 30 A/m.

50 Hz

Planes	Observations	Result
X plane	No effects observed	Pass
Y plane	No effects observed	Pass
Z plane	No effects observed	Pass

60 Hz

Planes	Observations	Result
X plane	No effects observed	Pass
Y plane	No effects observed	Pass
Z plane	No effects observed	Pass

Result: Complies.

The device displayed immunity to Power Frequency Magnetic Fields tests.

The device continued to operate normally after the test.

9. ACCREDITATIONS

The tests were carried out in accordance with the terms of EMC Technologies (NZ) Ltd's International Accreditation New Zealand (IANZ) Accreditation to NZS/IEC/ ISO 17025.

All measurement equipment has been calibrated in accordance with the terms of EMC Technologies (NZ) Ltd's International Accreditation New Zealand (IANZ) Accreditation to NZS/IEC/ ISO 17025.

International Accreditation New Zealand has Mutual Recognition Arrangements for testing and calibration with various accreditation bodies in a number of economies. This includes NATA (Australia), UKAS (UK), SANAS (South Africa), NVLAP (USA), A2LA (USA), SWEDAC (Sweden). Further details can be supplied on request.
